# وراثت در کلاس ها

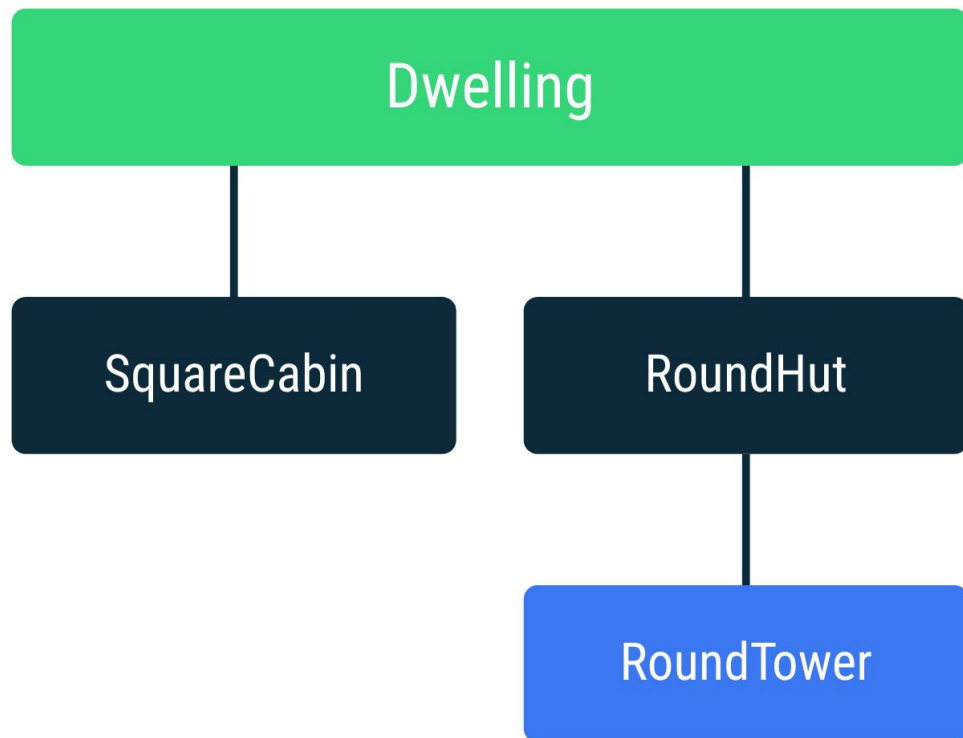

# نمونه وراثت در اندروید

```
kotlin.Any  
↳ android.view.View  
    ↳ android.widget.TextView  
        ↳ android.widget.Button
```

# مثال از تعریف کلاس و ارث بری

# تعریف کلاس پایه

```
abstract class Dwelling(private var residents: Int) {  
  
    abstract val buildingMaterial: String  
    abstract val capacity: Int  
  
    fun hasRoom(): Boolean {  
        return residents < capacity  
    }  
}
```

## تعریف یک کلاس فرزند

```
abstract class Dwelling(private var residents: Int) {  
    abstract val buildingMaterial: String  
    abstract val capacity: Int  
  
    fun hasRoom(): Boolean {  
        return residents < capacity  
    }  
}  
  
class SquareCabin(residents: Int) : Dwelling(residents) {  
    override val buildingMaterial = "Wood"  
    override val capacity = 6  
}
```

# استفاده از کلاس تعریف شده

```
fun main() {  
    val squareCabin = SquareCabin(6)  
  
    println("\nSquare Cabin\n=====")  
    println("Capacity: ${squareCabin.capacity}")  
    println("Material: ${squareCabin.buildingMaterial}")  
    println("Has room? ${squareCabin.hasRoom()}")  
}
```

```
Square Cabin  
=====  
Capacity: 6  
Material: Wood  
Has room? false
```

## ساده کردن کد

```
with(squareCabin) {  
    println("\nSquare Cabin\n=====")  
    println("Capacity: ${capacity}")  
    println("Material: ${buildingMaterial}")  
    println("Has room? ${hasRoom()}")  
}
```

## تعریف کلاس که میتواند فرزند داشته باشد

```
open class RoundHut(residents: Int) : Dwelling(residents) {  
    override val buildingMaterial = "Straw"  
    override val capacity = 4  
}  
  
class RoundTower(residents: Int) : RoundHut(residents) {  
    override val buildingMaterial = "Stone"  
    override val capacity = 4  
}
```

## مقدار اولیه برای متغیر یک تابع

```
class RoundTower(  
    residents: Int,  
    val floors: Int = 2) : RoundHut(residents) {  
  
    override val buildingMaterial = "Stone"  
    override val capacity = 4 * floors  
}
```

# تعريف تابع مساحت

```
abstract class Dwelling(private var residents: Int) {  
  
    abstract val buildingMaterial: String  
    abstract val capacity: Int  
  
    fun hasRoom(): Boolean {  
        return residents < capacity  
    }  
  
    abstract fun floorArea(): Double  
}
```

```
class SquareCabin(residents: Int,  
    val length: Double) : Dwelling(residents) {  
  
    override val buildingMaterial = "Wood"  
    override val capacity = 6  
  
    override fun floorArea(): Double {  
        return length * length  
    }  
}
```

```
open class RoundHut(val residents: Int,  
    val radius: Double) : Dwelling(residents) {  
  
    override val buildingMaterial = "Straw"  
    override val capacity = 4  
  
    override fun floorArea(): Double {  
        return PI * radius * radius  
    }  
}
```

```
class RoundTower(residents: Int, radius: Double,  
    val floors: Int = 2) : RoundHut(residents, radius) {  
  
    override val buildingMaterial = "Stone"  
    override val capacity = 4 * floors  
  
    override fun floorArea(): Double {  
        return super.floorArea() * floors  
    }  
}
```

# تعریف یک تابع مشترک دیگر

```
fun getRoom() {  
    if (capacity > residents) {  
        residents++  
        println("You got a room!")  
    } else {  
        println("Sorry, at capacity and no rooms left.")  
    }  
}
```
